

Smart Waste Monitoring System

Analytics & Performance Report

Report Generated: 2026-08-24 18:59:59
Generated By: Smart Waste Monitoring System

System Overview

This report presents analytics generated from the smart waste monitoring system. The system analyses bin fill levels, identifies collection priorities using a rule-based DSS, and logs collection events separately from sensor telemetry.

Metric	Value
Total Telemetry Records	580
Average Fill Level	47.3%
Critical Records (≥80%)	92
Highest Risk Bin	BIN-001
Highest Fill Level	94%
Total Collection Events	56
Most Collected Bin	BIN-002
Avg Fill at Collection	98.3%

Historical Trend Analysis

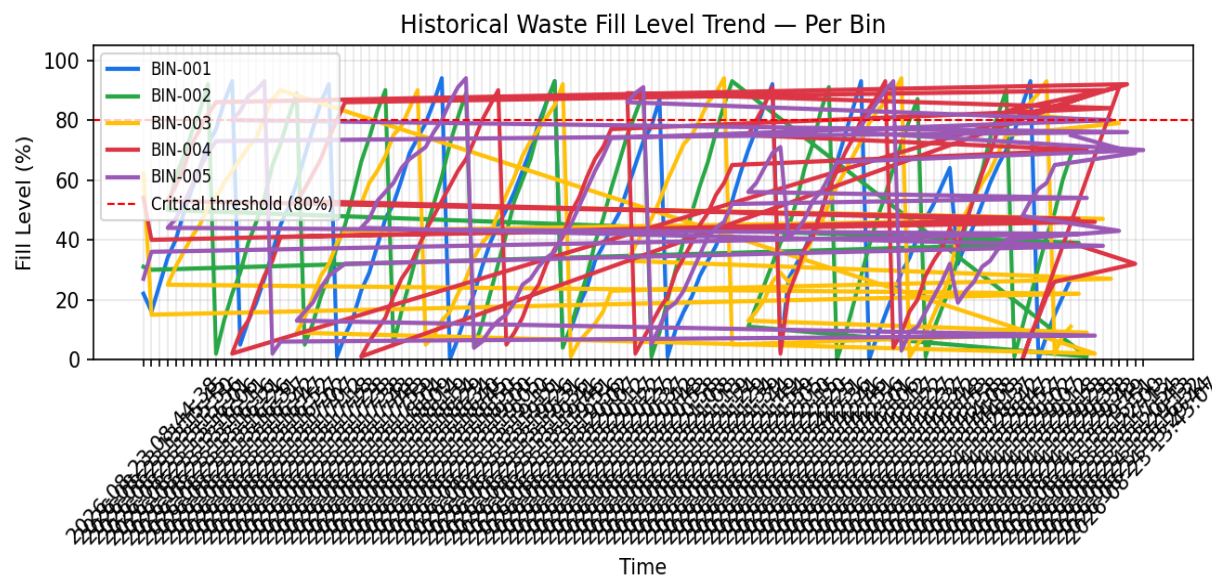

Figure 1. Historical waste fill level trend across recorded sensor readings.

Risk Distribution Analysis

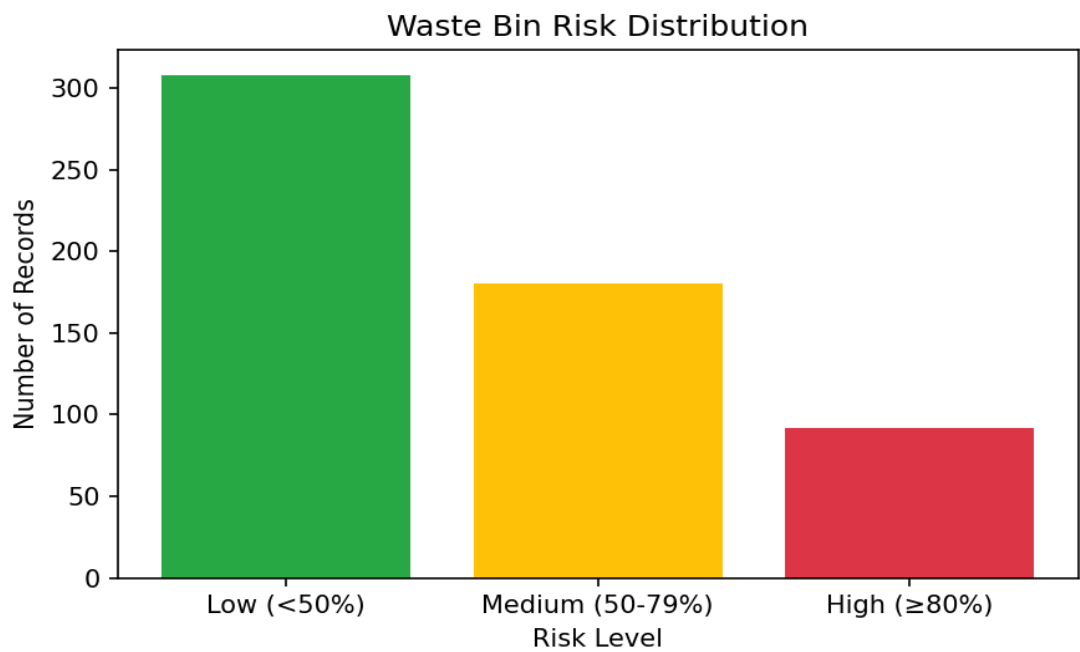

Figure 2. Distribution of low, medium, and high-risk waste records.

Collection Events Summary

The following table summarises bin collection events recorded in the *collection_events* table — stored separately from sensor telemetry to enable clean queryability of actual emptying events.

Bin ID	Location	Fill at Collection (%)	Collected At
BIN-003	Slave Island	99%	2026-08-24 13:29:38
BIN-001	Colombo Fort	100%	2026-08-24 13:29:28
BIN-004	Bambalapitiya	99%	2026-08-24 13:29:18
BIN-002	Pettah Market	100%	2026-08-24 13:29:12
BIN-002	Pettah Market	96%	2026-08-23 13:43:58
BIN-003	Slave Island	100%	2026-08-23 13:43:48
BIN-005	Wellawatte	96%	2026-08-23 13:43:42
BIN-004	Bambalapitiya	99%	2026-08-23 13:43:37
BIN-001	Colombo Fort	99%	2026-08-23 13:43:22
BIN-002	Pettah Market	100%	2026-08-23 13:43:01

System Assessment

The analytics module successfully evaluates historical waste accumulation trends and identifies high-priority collection requirements. The rule-based DSS applies configurable fill-level thresholds to generate actionable recommendations. Collection events are stored in a dedicated table, enabling independent analysis of collection frequency and bin-level performance.
